

APLNG has the largest undeveloped CSG reserves in Australia, located in the Surat and Bowen Basins.

The gas fields component of the Project, referred to as the Walloons Gasfield, covers an area of approximately 370,000 hectares extending from Wallumbilla to Millmerran on the Darling Downs in Queensland.

It is anticipated that the development of this gas field will occur over the next 30 years.

Drilling and completion activities will typically target 350 wells per year, but there may be times when the development may need to be accelerated to up to 500 wells per year.

Typically, the well spacing will be based on a 750 metres (m) apart. However, there may be areas where the spacing may range between 500 and 2,000 m, depending upon gas production and drilling techniques.

Gas produced from the field will be transferred via the gathering network to the gas plants also located in the field. The gas pressure is increased for transfer into the main transmission pipeline which enables delivery to the LNG plant.

APLNG is a CSG to LNG Joint Venture between Origin and ConocoPhillips
